### **DETAILED ACTION**

The Amendment filed on 5/15/06 has been received and entered in the case. In response to Applicant's amendment, the rejection made in the last Office action on the Yau et al reference is withdrawn. A new Office action has been made as follows:

#### ***Drawings***

Figures 1-3 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

#### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-5, 13-16 and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Seo (Ref. No. 1999-2552) and further in view of Takashi (Ref. No. 62-157398).

Art Unit: 2816

Seo discloses in the drawings a high speed bus interface circuit including a gate circuit (11), an output driver (13), a data channel (12), a precharging control signal to precharge the data channel (12) before a data bit is input (maintaining a transmission line in a termination voltage level in a standby mode before transferring a data signal).

However, this reference does not specifically disclose "precharging the data channel" as cited in claim 1.

Takashi teaches a semiconductor memory device for precharging an I/O line to the intermediate value between a power voltage and a ground voltage before latching.

It would have been obvious at the time the invention was made to a person having ordinary skill in the art to employ the teaching as taught in Takashi reference for the preliminary charge of the data channel in Seo since it is well known that before transmitting data, they commonly use a predetermined voltage to preliminary charge the data channel. Moreover, it is well known that the data channel is charged with a specific voltage for the purposes of providing data transmission at high speed.

The same motivation applied to claim 1 is applied to claims 2-4.

Regarding claim 5: the output driver includes first and second transistor (inherently seen in 13).

The same motivation applied to claims 1-5 are applied to claims 13-16 and 21.

#### ***Allowable Subject Matter***

Claim 6 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claims 7-12, 17-19 and 22 are allowable over the prior art of record.

***Conclusion***

In view of the above noted new grounds of rejection not necessitated by Applicants Amendments, this action is non-final.
